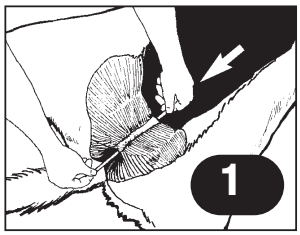
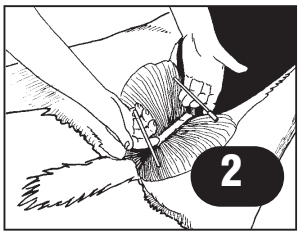
Zip Saw ™ Instructions

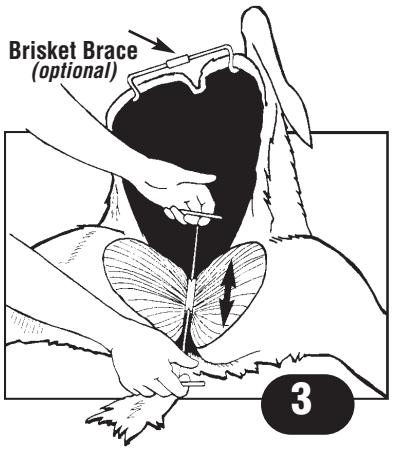
The Ultimate Pelvic Bone Saw

"Newly developed method saws bones in seconds!"

- Surgical stainless steel wire blade cuts the pelvic bone with an upward sawing motion in seconds!
- Reduces the risk of hand injury from sharp bones, knives and saw blades.
- No more punctured entrails or broken knives from pounding & prying.
- Ensures top quality of game meat while field dressing.
- High-quality stainless steel tool includes a handcrafted pouch that fits in your shirt pocket.







Use a side-to-side sawing motion while applying light upward pressure.

One of the trickiest and often difficult tasks involved in field dressing any big game animal is splitting the pelvic bone. Using the Zip Saw™ allows hunters to field dress with less effort under any circumstances.

Directions: *(See Illustrations)*

1. After the animal is on its back and the pelvic bone has been exposed, use your hunting knife to make an incision inward from the back side of the animal just below the pelvic bone, thus allowing an exit hole for the push rod.
2. Couple the two handles together, creating a one-piece push rod.
3. From the organ side of the animal, thread the push rod under the pelvic bone until one end emerges out the incision in the back.

   At this point, pull the two rods apart leaving the wire saw threaded under the pelvic bone and a "T" handle in each hand.

   Keep hands at least 12" apart. Saw by pulling ***side-to-side*** while applying light upward pressure. Allow the blade to do the cutting.

IMPORTANT NOTE: For extended blade life, use full length strokes of the blade.
